

Historical Drought Analysis for: Oklahoma Panhandle, Climate Division 8

Introduction

The National Drought Policy Commission Report in 2000 defined drought as a persistent and abnormal moisture deficiency having adverse impacts on vegetation, animals, or people. This study aims at providing drought information to tribal, local, or regional officials by examining the patterns and characteristics of droughts that have occurred in Oklahoma climate division 8 (CD8), also known as the Panhandle division. **CD8 covers most of Chickasaw, western Choctaw, and far-eastern Kiowa-Comanche-Apache-Fort Sill Apache tribal jurisdictions and Atoka, Bryan, Carter, Coal, Garvin, Jefferson, Johnston, Love, Marshall, Murray, Pontotoc, and Stephens counties.** Oklahoma is comprised of nine climate divisions (CDs). CD boundaries are based on temperature and precipitation averages of reporting stations in the state¹. The following historical drought characteristics for CD8 are described in this document:

- Average and maximum duration of past drought events, in months
- Average and maximum intensity of past drought events
- Average month of drought onset and termination
- Characteristics of the 10 longest drought events
- Climatology of drought events
- Wet periods (i.e. drought breaks)

Drought Indices

The data used in this analysis were the drought indices extracted from the National Centers for Environmental Information (NCEI) Center for Weather and Climate (formerly the National Climatic Data Center, NCDC). The drought data are publicly available and the description of the variables is available on the NCEI-CWC website². A by-product database was produced containing the following indices and variables for all Oklahoma climate divisions. The purpose of this by-product database was to compare indices and determine the most useful information for this document.

- Palmer Drought Severity Index (PDSI)
- Palmer Hydrological Drought Index (PHDI)
- Modified Palmer Drought Severity Index (PMDI)
- Palmer Z-Index (ZNDX)
- Standardized Precipitation Index (SPI) in 1-, 2-, 3-, 6-, 9-, 12-, and 24-month time period
- Temperature Data
- Precipitation Data

To quantify drought events, several drought indices have been previously developed by various agencies and organizations based on specific criteria. Planners and managers look at the indices to help them decide when to start implementing measures

¹ Guttman and Quayle (1995)

to mitigate drought impacts. The strengths and weaknesses of PDSI, and the explanation for the development of the modified PDSI are presented on the website of the National Drought Mitigation Center³. PDSI uses observations or estimates of precipitation, temperature and soil water content. The NCEI’s explanation for modifying the PDSI is as follows:

The Modified Palmer Drought Severity Index (PMDI) was instituted by the National Weather Service Analysis Center, who modified the PDSI for operational meteorological purposes. The PMDI and PDSI have the same value during an established drought or wet spell but they have different values during transition periods. The PMDI incorporates a weighted average of the wet and dry index terms, using probability as the weighting factor.

An index that can be employed to illustrate short- and long-term droughts is the Standardized Precipitation Index (SPI). SPI is based only on precipitation but has the advantage of showing multiple time scales, from 1-month to 24-month time period. The 24-month SPI time scale shows the longer duration droughts whereas the 1-3 month time scale shows the shorter duration droughts. The aforementioned indices were plotted for the years 1895-2014. All of the drought events were captured by each index.

After considering the pros and cons of both indices, the PMDI was chosen for this analysis over PDSI. The PMDI is represented by a single value that can serve as a tool in real time monitoring and assessment of drought conditions. The U.S. Drought Monitor also provides way to understand historical and current droughts but the dataset only goes back to the year 2000.

Analyzing a drought index provides a way to compare drought length and magnitude over time. For PMDI, a value of 0 indicates normal conditions, positive values indicate wet conditions, and negative values indicate dry conditions. The negative PMDI is divided into five categories, some of which indicate drought. For this study, the Palmer Classification⁴ was adopted to categorize the drought intensity or severity. Table 1 lists the drought intensity categories used in this study.

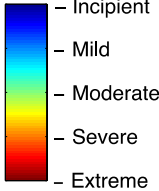

| PMDI Value | Drought Category | Color Designation |
|---------------|-------------------|---|
| 0 to -0.49 | Normal |  <ul style="list-style-type: none"> – Incipient – Mild – Moderate – Severe – Extreme |
| -0.5 to -0.99 | Incipient Drought | |
| -1.0 to -1.99 | Mild Drought | |
| -2.0 to -2.99 | Moderate Drought | |
| -3.0 to -3.99 | Severe Drought | |
| -4.0 or less | Extreme Drought | |

Table 1. Drought index values and respective categories and colors.

Drought Analysis

The drought characteristics derived from the analysis reflect the various aspects of individual drought events. The drought metrics that were used in this study included

³ <http://drought.unl.edu/Planning/Monitoring/ComparisonofIndicesIntro/PDSI.aspx>

⁴ <http://drought.unl.edu/Planning/Monitoring/ComparisonofIndicesIntro/PDSI.aspx>

frequency of drought events in each climate division, onset and termination date, duration, peak intensity, date of peak intensity, duration of breaks, total precipitation, and percent of normal precipitation. Please note that most recent 1981-2010 monthly precipitation normals were used for the relevant calculations, which means that the precipitation statistics for each drought event were compared to the corresponding average precipitation statistics for the 30 year period between 1981 and 2010. The impacts of drought are manifested in severity and duration. Droughts have occurred in all Oklahoma climate divisions but each drought event possesses unique characteristics. Droughts differ in intensity, duration, and other attributes.

Characteristics of Drought in CD8

Table 2 shows the average, maximum, and minimum of drought variables in CD8, implying the characteristics of historical drought conditions in this division.

| Climate Division 8 Drought Characteristics | | | |
|---|--------|--|---------|
| Averages | | | |
| Drought Onset (day-month) | 12-Jul | Drought End (day-month) | 20-Jul |
| Drought Event Duration (months) | 5.97 | Incipient Dry Spell Duration (months) | 0.95 |
| Mild Drought Duration (months) | 1.74 | Moderate Drought Duration (months) | 1.57 |
| Severe Drought Duration (months) | 1.03 | Extreme Drought Duration (months) | 0.68 |
| Peak Intensity (0 to -4 scale) | -2.13 | Peak Intensity Occurrence (day-months) | 28-Jul |
| Break Between Drought Events (months) | 9.01 | Average Percent of Normal Precip. | 57.41 |
| Maximum | | | |
| Drought Event Duration (months) | 40 | Incipient Dry Spell Duration (months) | 3 |
| Mild Drought Duration (months) | 8 | Moderate Drought Duration (months) | 12 |
| Severe Drought Duration (months) | 10 | Extreme Drought Duration (months) | 18 |
| Peak Intensity (0 to -4 scale) | -7.28 | Date of Maximum Peak Intensity (mm/yyyy) | 06/1911 |
| Break Between Drought Events (months) | 74 | Maximum Percent of Normal Precip. | 103.04 |
| Minimum | | | |
| Break Between Drought Events (months) | 2 | Minimum Percent of Normal Precip. | 10.75 |

Table 2. List of the averages, maximums, and minimums of drought variables for the period 1895-2014.

Major Drought Events in CD8

Droughts that lasted for more than 12 months were classified as major drought events in this study. Prolonged droughts have more consequences and adverse impacts on society. Table 3 lists the ten longest drought events in CD8. The duration (in months) under a specific drought intensity category is shown. The peak intensity (the lowest PMDI value) during each drought's occurrence, year/month when the peak intensity has occurred, total precipitation, departure from normal precipitation, and percent of normal precipitation are also included in the table.

| Climate Division 8 | | | | | | | | | | | | |
|----------------------------|--------------------------|------------------------|-------------------------------------|--------------------------------|------------------------------------|----------------------------------|--------------------------------|-------------------|---------------------------|---------------------------|--------------------------------------|---------------------------|
| Start Date (Year/Month) | End Date (Year/Month) | Duration (# Months) | Incipient Duration (# Months) | Mild Duration (# Months) | Moderate Duration (# Months) | Severe Duration (# Months) | Extreme Duration (# Months) | Peak Intensity | Peak Date (Year/Month) | Total Precip. (in.) | Departure from Normal (in.) | % of Normal Precip. |
| 1909/04 | 1912/07 | 40 | 1 | 5 | 7 | 9 | 18 | -7.28 | 1911/06 | 93.14 | -45.41 | 67.22 |
| 1916/10 | 1918/11 | 26 | 2 | 4 | 7 | 10 | 3 | -4.27 | 1918/08 | 64.38 | -24.30 | 72.60 |
| 1924/07 | 1926/06 | 24 | 0 | 3 | 6 | 7 | 8 | -6.49 | 1925/08 | 54.27 | -27.15 | 66.65 |
| 1900/12 | 1902/10 | 22 | 2 | 4 | 5 | 8 | 3 | -4.93 | 1902/02 | 58.12 | -20.41 | 74.01 |
| 1938/09 | 1940/05 | 21 | 0 | 2 | 12 | 5 | 2 | -4.35 | 1940/03 | 50.88 | -20.46 | 71.32 |
| 1951/11 | 1953/07 | 21 | 2 | 4 | 6 | 7 | 2 | -4.48 | 1952/10 | 51.87 | -18.65 | 73.55 |
| 1979/10 | 1981/06 | 21 | 2 | 6 | 11 | 1 | 1 | -4.23 | 1980/08 | 55.07 | -17.07 | 76.34 |
| 1933/10 | 1935/04 | 19 | 2 | 6 | 5 | 4 | 2 | -4.45 | 1934/08 | 44.80 | -17.29 | 72.15 |
| 1963/02 | 1964/08 | 19 | 2 | 3 | 1 | 8 | 5 | -4.49 | 1963/10 | 43.87 | -21.73 | 66.88 |
| 1955/10 | 1957/03 | 18 | 0 | 1 | 3 | 3 | 11 | -7.06 | 1956/09 | 33.74 | -24.73 | 57.70 |

Table 3. Ten longest drought events in climate division 8. Departure from normal and percent of normal calculations were based on the 1981-2010 monthly precipitation normals (i.e. averages).

Climatology of Drought Events in CD8

The chronology and evolution of drought events for the entire period of record is plotted and shown on a decadal interval in figures 1a-1d. Major droughts were classified as having more than 12 months duration and listed on top of the graph. The magnitude of drought progressing on monthly time scale is represented by negative index value that also indicates the onset and termination of the event. The major drought events are shown in more negative index values as indicated by more red color category.

As seen in the graphs of drought indices, the 1909/04-1912/07 drought was the most prolonged and lasted for 40 months. It was also the most severe drought with record low PMDI of -7.28 over the historical period 1895-2014. The drought of 1916/10-1918/11 had the second longest duration and lasted for 26 months with a lowest PMDI of -4.27. The second most severe drought occurred between 1955/10 and 1957/03, lasting for 18 months and its lowest PMDI was -7.06. CD8 experienced some droughts in the 1930s but they were not as prolonged and intense as other regions in Oklahoma.

Some droughts were also severe but relatively short in duration. These were the droughts in 1924/07-1926/06 (-6.49 PMDI), 2005/10-2006/12 (-5.38 PMDI), and 2010/10-2012/02 (-6.13 PMDI). The long-duration wet periods in CD8 were observed in the late 1900s, much of the 1940s, and most of the 1980s and 1990s. CD8 had a total of 103 drought events during the entire period of record.

Fig. 1b. Same as Fig. 1a, but for 1930-1959 drought events.

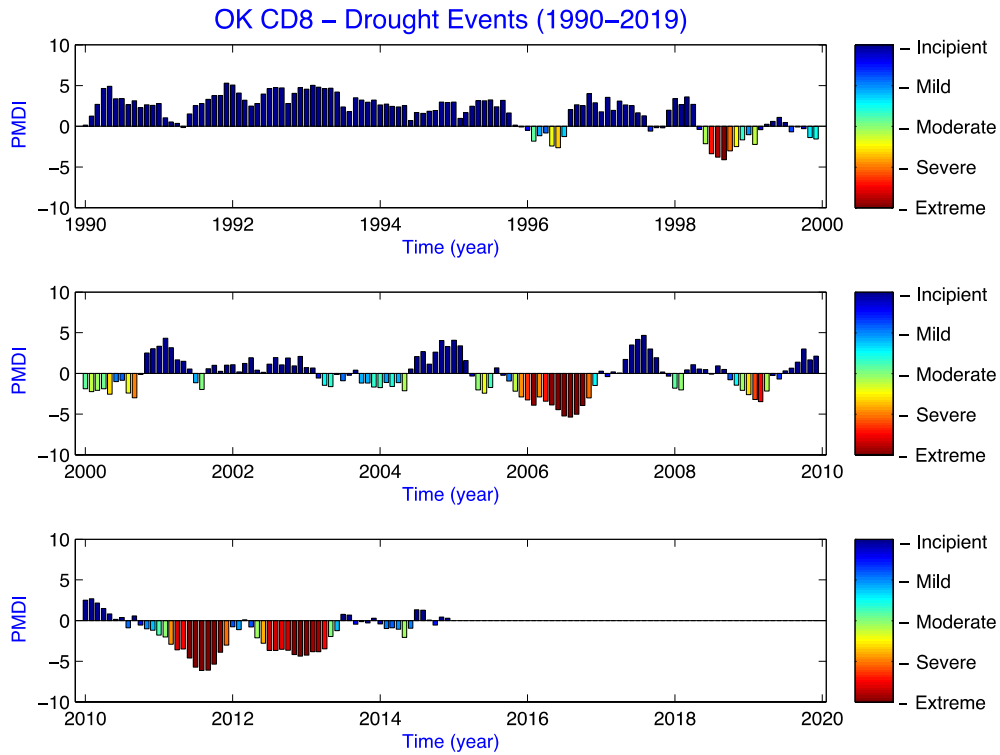

Fig. 1c. Same as Fig. 1a, but for 1960-1989 drought events.

* Drought Event that lasted longer than 12 months

Fig. 1d. Same as Fig. 1a, but for 1990-2014 drought events.

Wet Period Duration

A wet period indicates the time (in months) between drought events. There were years when only 1 break or wet period was observed whereas other years had 2 or more breaks. These breaks are shown in figures 2a and 2b. The number of bars per year indicates the number of breaks that a particular year had. The longest wet period for CD8 was 74 months, the shortest wet period was 2 months and the average wet period was 9 months. A very short wet period between some drought events indicates a short or very little recovery before the next drought occurred.

Fig. 2a. Breaks or wet periods each year, 1895-1954.

Fig. 2b. Same as Fig. 2a, but for 1955-2014.

Additional Data

Raw data are available from SCIPP as a Microsoft Excel file. If you would like to access this data, contact SCIPP at scipp@southernclimate.org or 405-325-7809.
